                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -1- SUBUNIT: Monomer.
-1- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
-1- MISCELLANEOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY:
-1- SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
-1- SIMILARITY: Contains 4 annexin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The amino acid sequence of protein II and its phosphorylation site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TISSUE-Small Intestine;

       -1- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
-1- MISCELLAMBOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY.
-1- SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
-1- SIMILARITY: Contains 8 annexin repeats.

Submitted (JAN-1997) to the BMBL/Genbank/DDBJ databases.

-1- FUNCTION: CALCIUM/PHOSPHOLIPID-BINDING PROTEIN WHICH PRONOTES
MEMBRANE FUSION AND IS INVOLVED IN EXOCYTOSIS (BY SIMILARITY).

-1- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.

-1- MISCELLANEOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY (BY SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.

-1- SIMILARITY: Contains 4 annexin repeats.
Mus musculus (Mouse).

Chicken growth plate cartilage matrix vesicles.";
Blochem. Blophys. Res. Commun. 197:556-561(1993).
I-FUNCTION: MAY ASSOCIATE WITH CD21. MAY REGULATE THE RELEASE OF
CA(2+) FROM INTRACELLULAR STORES (BY SIMILARITY).
I-DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
I-SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
I-SIMILARITY: Contains 8 annexin repeats.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                              US-09-970-969-6

"Annexin 4 (Xanx-4) has a role in the development of the pronephric tubules in Xanopus laevis.";
Submitted (JUN.2010) to the EMBL/GenBank/DDBJ databases.
-1- DOMAIN: A PAIR OF ANNEXIN REPEATS MAY FORM ONE BINDING SITE FOR CALCIUM AND PHOSCHOLIPID (BY SIMILARITY).
-1- SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
-1- SIMILARITY: CONTAINS 4 ANNEXIN REPEATS.

/note="Vector: pCMVSPORT_6" ist strand cDNA was primed

with a NotI-oilgo(dT) primer. Five prime end enriched,

double-strand cDNA was digested with Not I and cloned into

the Not I and EcoRV sites of the pCMVSPORT 6 vector.

Library was not normalized." 38 others
